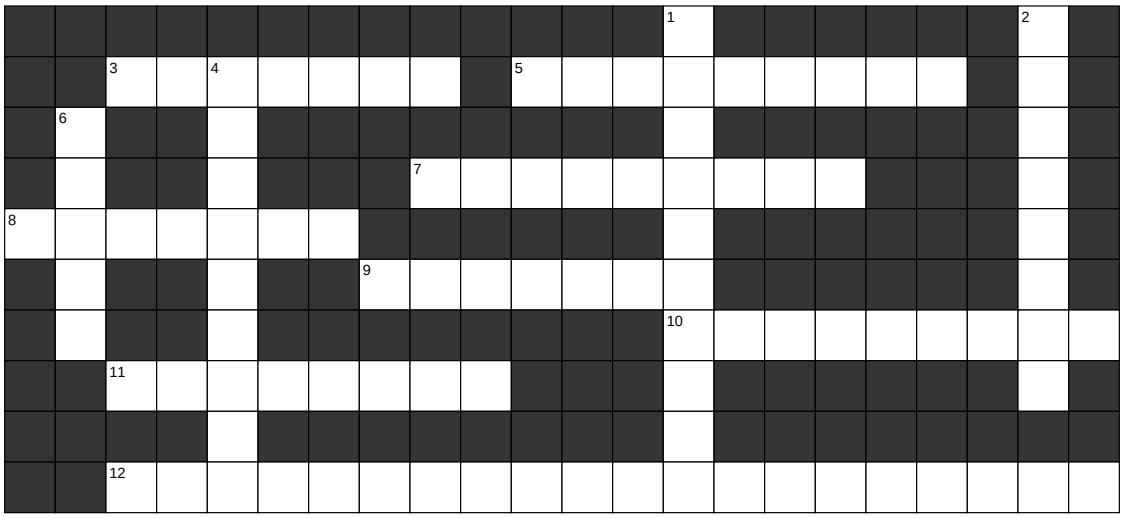
Conditional Statements

Crossword - Chapter review

Use chapter concepts to solve the clues. Omit spaces and punctuation in the grid.



Across

3. `if (true) { x=1 }` _____ `x` in whatever environment the `if` statement itself was evaluated in, the same as an unconditional `x=1;` would.

5. (1) Exactly one branch of an `if` _____ runs.

7. This chapter adds that choice: picking which statements execute at all, based on a _____ checked while the program runs, without stopping it.

8. _____ about expressions, `exit`, `assert`, or the `(value, status)` pair changes.

9. This chapter adds that choice: picking which statements execute at all, based on a condition checked while the _____ runs, without stopping it.

10. The other is not merely skipped in the sense of producing no output: it is never _____ at all.

11. The branch that is not _____ is never evaluated: This prints `only this branch runs` and nothing else.

12. That choice is _____, one of the handful of control-flow constructs every general-purpose language provides.

Down

1. This chapter adds that choice: picking which _____ execute at all, based on a condition checked while the program runs, without stopping it.

2. `parse_if_statement` checks for a following `else` right after it finishes parsing its own `then` block, before returning control to _____ called it.

4. `{ x=1; }` and `{ x=1 }` both parse the same way, the same as a trailing _____ at the end of a program always has.

6. It is always a _____: a statement list wrapped in braces.
