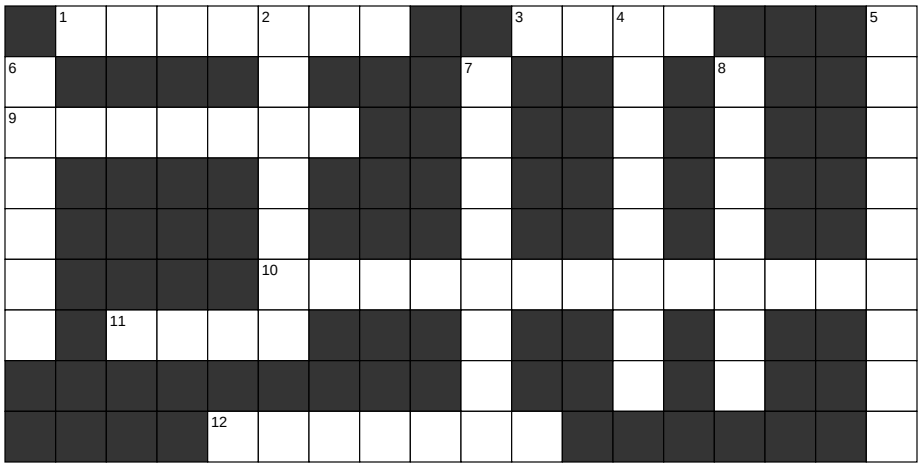
Loops

Crossword - Chapter review

Use chapter concepts to solve the clues. Omit spaces and punctuation in the grid.



Across

1. The same table with an initial value of `3` _____ of `0` has only one row: the body never runs at all.

3. A _____ checks a condition, runs a block, and checks the condition again, for as long as it holds.

9. `while (i < 3) { print(i); }` with no update at all prints `0` until something else stops the _____.

10. A claim like this, checked before the loop starts and preserved by every iteration, is a _____.

11. - _____: `print(i)`.

12. }` by hand: The condition is _____ one more time than the body runs.

Down

2. The resulting tree has two parts: a condition expression and a body, which is an ordinary `statement_list` node, _____ like an `if` branch.

4. It is the _____ way every loop ends.

5. An `if` statement checks a _____ once and picks a branch.

6. - _____: `i = i + 1`.

7. `break` and `_____` need even less: each is just a keyword, with no condition, no argument, and no block of its own.

8. _____ about `if`, blocks, or the `(value, status)` pair changes.
