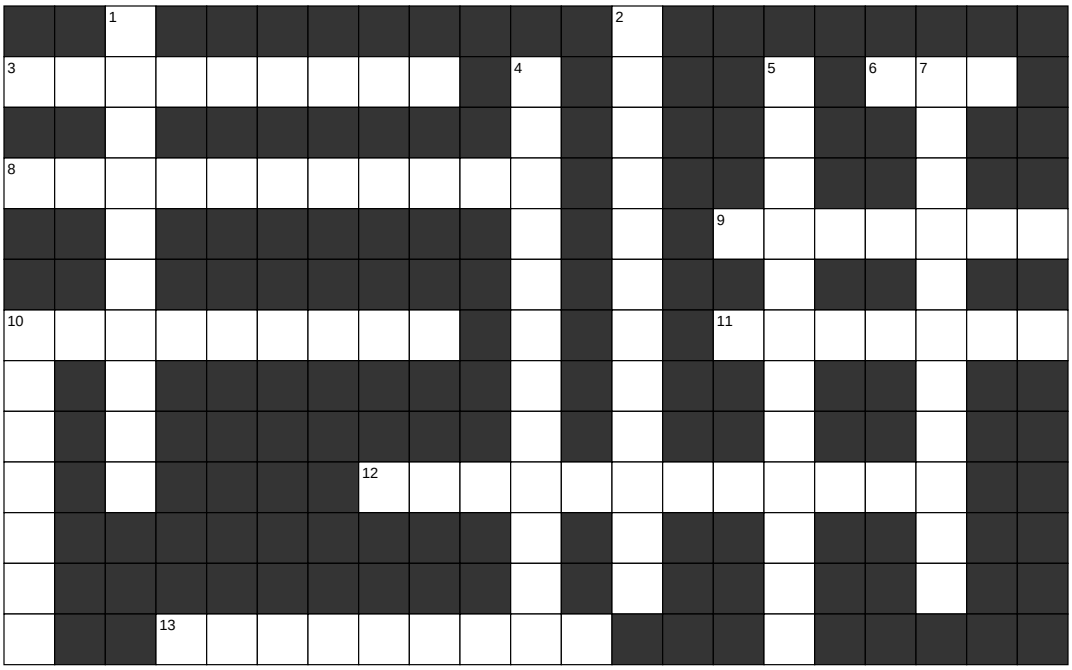
Scope and Closures

Crossword - Chapter review

Use chapter concepts to solve the clues. Omit spaces and punctuation in the grid.



Across

3. A nearer binding hides an outer binding with the same name without changing it.

6. Keyword that updates the nearest existing binding and rejects an undefined name.

8. Another name for lexical scope.

9. An association between a name and a value in a particular environment.

10. The fresh environment a function call creates for its parameters and local variables.

11. A function whose calls construct separate instances with private state.

12. Scope rule that finds outer names through the caller's environment.

13. A name that receives an argument's value in a fresh call environment.

Down

1. A returned operation whose possession grants access to a particular action on private state.

2. Having a path of references to a retained environment, even after its factory call finishes.

4. A name used by a function without being bound locally by that function.

5. Scope rule that finds outer names through the function's defining environment.

7. The runtime structure holding bindings and a link to its enclosing scope.

10. A function together with the environment that supplies its outer bindings.
