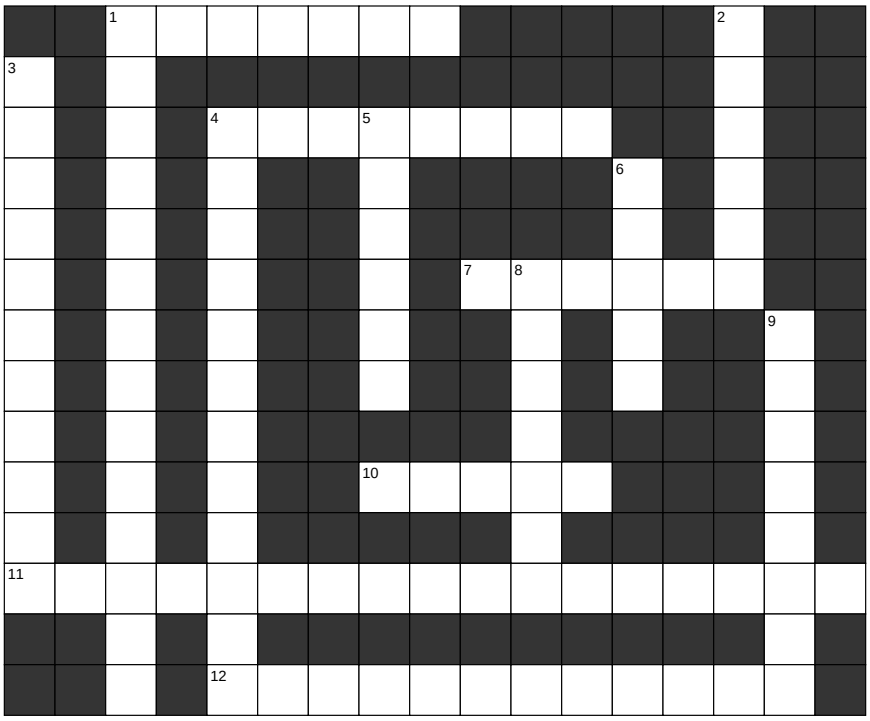
Native Functions and Modules

Crossword - Chapter review

Use chapter concepts to solve the clues. Omit spaces and punctuation in the grid.



Across

1. A function retaining the defining environment used to resolve its outer names.

4. Mapping from interface names to implementations supplied by the host.

7. Function constructor that connects a registered host operation to a Vertex parameter list.

10. The number of arguments declared by a function's parameter list.

11. The actual binding storage shared by a module object and its exported closures.

12. The language used to implement this interpreter, Python in this chapter.

Down

1. A dependency cycle where loading files eventually requests a file already being loaded.

2. A program whose global environment becomes the object returned by import.

3. Host input/output state kept outside the ordinary fields of a module object.

4. A file location resolved against the importing file's directory.

5. Supplied function that loads a file, evaluates its program, and returns its globals.

6. Another binding referring to the same module object or function value.

8. A wrapper that converts a host-specific result into a supported Vertex value.

9. One independent execution of a module program and its resulting state.
